METHOD AND SYSTEM FOR RELATIONSHIP BUILDING FROM XML

ABSTRACT OF THE DISCLOSURE

A method, system and article of manufacture for relationship building based on text-based markup languages and, more particularly, for representing relationships between data elements defined according to a first physical representation of data in a logical representation. The logical representation abstractly describes a second physical representation of the data, which is generated from the first physical representation of the data. On the basis of the relationships between the data elements, logical relationships each defining a path between data structures of the second physical representation are determined and associated with the logical representation.
